Introduction

This document provides guidance in setting up the Apollo3 Blue Plus Evaluation Board (EVB), part number AMA3B2EVB, revision 1.0, to get started executing code examples, measuring power consumption in various configurations, and beginning software development.

RF Certification Information

Model PIN: AMA3B2EVB

Product Name: AMA3B2EVB

FCC ID: 2APPJ2102154167100

CMIIT ID: 2020DP3158(M)

TELEC No.: 201-200123

Ambiq Micro, Inc.

Apollo3 Blue Plus EVB

2.1 Overview

The Apollo3 Blue Plus EVB features Arduino-compatible headers and an integrated J-Link debugger.

Figure 2-1: Apollo3 Blue Plus EVB, Revision 1.0

Figure 2-2: Apollo3 Blue Plus EVB Parts Diagram

The EVB has these additional features:

- Low power reference design
- Apollo3 Blue Plus SoC in the BGA package (AMA3B2KK-KBR)
- Multiple power/clock options
- Micro USB Type C connector for power/download/debug
- On-board PCB (MIFA) antenna
- FTDI USB-to-SPI adapter/interface
- RF switch/connector (J1 - Murata MM8430-2610RA1) for Bluetooth Low Energy PHY testing
- Segger J-Link debugger
- Debugger-in port
- Debugger-out port with connection-indication LED
- Five user-controlled LEDs
- Three push buttons for application use, plus a reset push button
- Power slide switch with LED power indicator
- Five 8-12 pin Arduino-style headers for pin/power access to shield board(s)
- Multiple test points for power measurements
- CE Mark and RoHS compliant

CAUTION: The EVB has components loaded on the back of the board. Care should be taken to not damage these components. Rubber feet have been applied to the bottom of the board to prevent direct contact between the components and a desk surface.

2.2 Secure Boot on the Apollo3 Blue Plus SoC

Apollo3 Blue Plus SoC parts from the Ambiq factory are preprogrammed with a Secure Bootloader and an uninitialized Customer InfoSpace, referred to as INFO0. Initial provisioning of the part would include programming a valid INFO0 and programming the main firmware image in the flash. The Apollo3 Blue Plus EVB is shipped with the INFO0 configuration preprogrammed with optimal settings for the EVB layout.

For your reference, the following settings are programmed into INFO0 on the Apollo3 Blue Plus SoC resident on the EVB:

- Simo Buck is enabled, which provides lowest Apollo3 Plus power consumption in both active and sleep modes.
- Secure Bootloader (SBL) interface is configured to UART using GPIO22 and GPIO23, which allows secure boot to be performed over the J-Link COM interface of the EVB.
- SBL override pin is configured to GPIO16 which is BTN1 on the EVB.
- All Flash and Debugger protection features are disabled.

For information on changing the INFO0 settings as well as using the Secure Bootloader, please refer to the Apollo3 Blue Getting Started Guide, which can be found in the Ambiq SDK documentation and example scripts located in the `\tools\apollo3_blue_scripts` folder. This folder contains a number of python scripts to demonstrate generation of INFO0 settings, customer main images, and the creation of images for the Wired Update protocol over UART.

SECTION

3

Debug Interface

The debug interface is supported by standard J-Link drivers from Segger. Refer to *Section 4 Software Development Tools* on page 12 for more details on J-Link debug support.

3.1 Use of External Debugger

This EVB also supports the use of an external Cortex SWD debug interface through a standard 10-pin debug header (DEBUG IN - J1) as shown in Figure 3-1.

Figure 3-1: Apollo3 Blue Plus EVB's Cortex DEBUG IN Header (J1)

Debug In Connector

No jumper changes are required to use an external debug adapter. Simply connect the external debug adapter with a 10-pin ribbon cable connector to the **DEBUG IN** header.

3.2 Use of J-Link Adapter as an External Target Board Debugger

The EVB also offers the ability to be used as a J-Link debug adapter for any target board that has an Apollo family SOC.

Figure 3-2: Apollo3 Blue Plus EVB's DEBUG OUT Header (J2)

Debug Out Connector

To utilize this functionality, use a 10-pin low-pitch standard debug connector to connect the **DEBUG OUT** header (J2) on the EVB to the debug header on the target board. The EVB will automatically detect when the **DEBUG OUT** header is connected to another target board and reconfigure the integrated J-Link to connect to this external board rather than the on-board Apollo3 Blue Plus.

Note: A voltage on pin 1 of the J2 header is required for the above mentioned automatic switch to occur. Also, if the target VDD does not match the on-board voltage (either 3.3V or 1.8V), and to avoid possible voltage level conflicts on the debug I/O port, VDDIO of the J-Link processor may need to be changed to the target voltage by cutting SB5 and shorting SB6.

An LED (D3) is on the board to indicate the presence of **VDD_EXT_DBG** on pin1 of the J2 header. When D3 is ON, the debugger is debugging external target board. When D3 is OFF, the debugger is debugging the on-board Apollo3 Blue Plus SoC.

4

Software Development Tools

The standard Segger J-Link debug interface is used on the Apollo3 Blue Plus EVB. Install the latest Segger J-Link software, and configure your preferred development IDE (Keil, IAR, or Eclipse) to use J-Link debug interface.

Links to development tools that support Apollo3 Blue Plus:

- SEGGER J-Link Software (6.48b Beta or later):
<https://www.segger.com/downloads/jlink>
- KEIL uVision 5 (MDK5.25 or later):
<https://www.keil.com/demo/eval/arm.htm>
- New Keil Pack (Also used by Eclipse):
<http://www.keil.com/dd2/pack/#/third-party-download-dialog>
- IAR Version (8.10.1 or later):
<https://www.iar.com/iar-embedded-workbench/tools-for-arm/arm-cortex-medition/>
- GCC 5.3.1:
<https://gcc.gnu.org>

Regardless of preferred IDE, install the Segger J-Link software. All of the above development environments support J-Link, but you must have the latest J-Link software installed. Most alternate development environments also are supported by J-Link.

Refer to the [AmbiqSuite Getting Started Guide](#) for more details on setting up development IDEs to use J-Link.

SECTION

5

Power Supply Options and Measuring Current

There are three power supply options for the Apollo3 Blue Plus EVB:

- Operate at 3.3V as provided by the on-board power supply
- Operate at 1.8V as provided by the on-board power supply
- Provide externally supplied power

Figure 5-1 shows header P19 which is used to select a power configuration through jumper installations, as well as the option to measure the supply current to the SoC with an ammeter. Solder bridge SB15 can be filled instead of jumpering from pin 1 to pin 2 if current measuring is of no interest.

Figure 5-1: Voltage Selection on Header P19

Table 5-1 on page 14 shows valid jumper configurations for P19. All other configurations are invalid. Note that a jumper across pins 7 and 8 is not necessary and does not do anything - the pins are available only for easy access to ground.

Table 5-1: Jumper Configuration for Power Selections

Jumper 1-2	Jumper 3-4	Jumper 5-6	Power Source
In	In	Out	3.3V operation from internal regulator
In	In	In	1.8V operation from internal regulator
Out	In	Out	Intended for current measuring across pins 1 and 2 during 3.3V operation from internal regulator
Out	In	In	Intended for current measuring across pins 1 and 2 during 1.8V operation from internal regulator
In	Out	Out	Externally-provided supply voltage within the allowable range (1.755-3.60V) on pin 3 or 5
Out	Out	Out	Intended for current measuring across pins 1 and 2 during externally-provided supply voltage within the allowable range (1.755-3.60V) on pin 3 or 5

As an example for setting the jumpers on P19, Figure 5-2 shows the EVB configured for 3.3V operation with jumper across **VDD_PS** and **VDD_MCU** for no current measurement.

Figure 5-2: Header P19 Configured for 3.3V Operation - No Current Measurement

Figure 5-3 shows the EVB configured for 3.3V operation with current measuring leads across **VDD_PS** and **VDD_MCU** for current measurement.

Figure 5-3: Header P19 Configured for 3.3V Operation - With Current Measurement

Measuring the current consumption of the target MCU on the board using equipment with a sensing resistor will create a burden voltage over the resistor on **VDD_MCU**. In some cases the burden voltage may be too high and may cause a brown-out event on the target MCU at 1.8V. SB1 on the board can be cut to make U8 (**VDD_PS_LDO** generator) output 1.9V instead of 1.8V in the low-voltage configuration. This will enable current consumption measuring using equipment with a sensing resistor, such as a digital multimeter.

Figure 5-4: Solder Bridge SB1

SECTION

6

FTDI Interface

The on-board FTDI chip (FT4222H) is a SPI to USB data streaming interface from the Apollo3 Blue Plus to the connected PC. Transfer speed can exceed 200KBytes/sec, and the user can send generic data and audio data to the PC over the interface at same time. Audio data is supported in raw PCM (16bit/16Khz), SPP and OPUS formats. Complete instructions for using the interface with provided software can be found in an article in the Ambiq Support Community Knowledge Base: <https://support.ambiq.com/hc/en-us/articles/360037829251>
